

MUHAMMAD BAQIR NAWAZ

Junior DevOps Engineer

AWS · Kubernetes (EKS) · Terraform · Docker · CI/CD · GitOps (Argo CD)

Professional Summary

Junior DevOps Engineer building and troubleshooting CI/CD pipelines and cloud infrastructure on AWS through hands-on projects. Flagship: a Secure GitOps Platform on EKS with Terraform-provisioned infrastructure, GitHub Actions authenticating via OIDC (no long-lived AWS keys), immutable images promoted across dev, staging, and production, and Argo CD self-healing deployments. Hands-on with Docker, Kubernetes, and Helm; monitors with Prometheus, Grafana, and CloudWatch. Diagnoses failures such as ImagePullBackOff, IAM permission errors, and ALB 503s down to root cause. Working knowledge of Linux, Bash, Python, and Git.

Technical Skills

Cloud (AWS): EC2, VPC, IAM, S3, EKS, ECS Fargate, ECR, ALB, CloudWatch, Security Groups

CI/CD & GitOps: GitHub Actions (OIDC, self-hosted runners, approval gates), Argo CD, GitFlow, Branch Protection

Infrastructure as Code: Terraform (modules, S3 remote state, DynamoDB locking)

Containers & Kubernetes: Docker, Docker Compose, Kubernetes, Helm, NGINX Ingress, HPA, Minikube

Linux & Scripting: Ubuntu, Bash, Python, SSH, systemd/journalctl, permissions, networking

Monitoring & Troubleshooting: Prometheus, Grafana, Alertmanager, CloudWatch, root cause analysis, incident response

Security: IAM least privilege, OIDC, secrets management, approval gates, branch protection

DevOps Projects

Secure GitOps Platform on AWS EKS | *Terraform · Argo CD · GitHub Actions* [Platform](#) | [Infra](#) | [App](#) | [Helm](#)

- Provisioned AWS VPC, EKS, IAM, and ECR with Terraform using least-privilege IAM, making the environment repeatable and version-controlled.
- Built GitHub Actions pipelines that authenticate to AWS via OIDC (no long-lived keys) and promote one immutable SHA-tagged image through dev, staging, and production without rebuilding.
- Configured Argo CD ApplicationSet with automated sync, self-heal, and prune so cluster state stays matched to Git.
- Deployed Prometheus, Grafana, and Alertmanager with ServiceMonitors for application health visibility across environments.
- Designed a four-repository architecture separating application source, image delivery, desired state, and deployment reconciliation, keeping CI and GitOps stages independent; diagnosed a GitHub Actions matrix/status-check issue.

Flask App on EKS with Helm CI/CD | *Docker · ECR · EKS · Helm · HPA · GitHub Actions* [GitHub](#)

- Migrated a containerized Flask app from Minikube to AWS EKS using Helm, ECR, health probes, HPA, and NGINX Ingress.
- Automated image build, ECR push, and Helm deployment with GitHub Actions, replacing manual deploy steps; pipeline runs in roughly 71 seconds.
- Set separate development and production replica counts and CPU targets for HPA autoscaling.
- Resolved IAM permission failures, Dockerfile path errors, Ingress conflicts, and ImagePullBackOff from a missing ECR tag; used Helm rollback to restore service after failed releases.

Flask on Kubernetes with HPA and CI/CD | *Docker · Kubernetes · NGINX Ingress · GitHub Actions* [GitHub](#)

- Containerized a Flask app with a multi-stage, non-root Dockerfile; deployed to Kubernetes with liveness/readiness probes behind NGINX Ingress.
- Configured HPA to scale between 2 and 6 pods at 60% CPU; GitHub Actions pipeline completes in about 54 seconds.

AWS ECS Fargate Flask CI/CD | *ECS Fargate · ECR · ALB · CloudWatch · GitHub Actions* [GitHub](#)

- Deployed a containerized Flask app to ECS Fargate behind an ALB, with GitHub Actions building, pushing to ECR, and deploying on every change to main.
- Added health checks and CloudWatch logging; resolved unhealthy target groups, ALB 503s, networking issues, and ECS circuit-breaker failures.

AWS Infrastructure as Code with Terraform / *VPC · EC2 · IAM · S3 · DynamoDB* [Lab](#) | [30-Day Labs](#)

- Provisioned EC2, security groups, key pairs, and VPC components with variables, outputs, providers, and data sources.
- Built reusable modules and configured S3 remote state with DynamoDB locking for safe, repeatable provisioning.

Multi-Environment CI/CD Pipeline / *GitHub Actions · GitFlow · Docker · Docker Hub* [GitHub](#)

- Implemented a three-environment (dev, staging, production) GitFlow workflow with automated testing, Docker builds, registry publishing, and environment-specific deployments.
- Gated production releases with GitHub Environments and manual approval; configured a self-hosted Ubuntu runner with Docker.

Additional hands-on: [AWS production outage simulation and RCA](#); [AWS 3-tier architecture](#); [EC2 SSH troubleshooting](#); Docker and Linux labs ([Docker networking](#), [Compose health checks](#), [Linux](#), [Bash scripting](#)).

Experience

Independent DevOps Training and Portfolio Projects / 2024 – Present

- Building and documenting hands-on AWS, Kubernetes, and CI/CD projects; source code on [GitHub \(baqir-ops\)](#).

Assistant Manager / *Unicore Cables, Lahore* 2021 – 2024

- Maintained accurate inventory, stock-movement, and operational records, supporting uninterrupted day-to-day production.
- Coordinated with vendors and production teams to align material supply with production requirements under time-sensitive conditions.
- Kept invoices, reports, and supporting documentation accurate and organized.
- Worked across operational teams to resolve supply and inventory issues quickly and communicate status clearly.

Education

MS Information Technology / *Ghazi University* 2018 – 2020

BSc Electronics Engineering / *The Islamia University of Bahawalpur* 2013 – 2017
